Assignment_01

Q1.

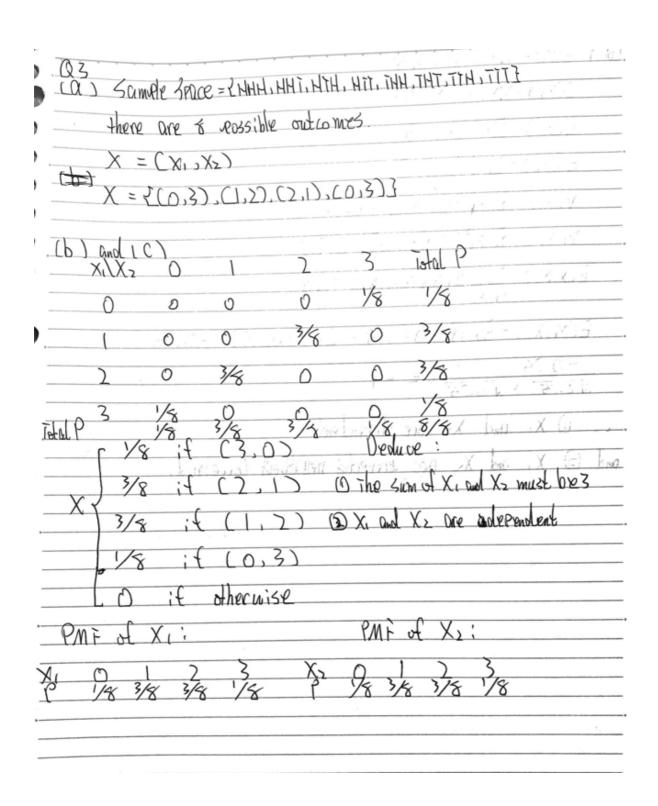

(a) A-C & B-C So the distribution of X is \[\text{\substitute} \text{\ti}\text{\tex{\tex
P(A-C) = 0.9 Point of running) = 0.1 N=10, $X=6$, $P=0.9$
and $P(x \ge 6) = 0.01116$ and $P(x \ge 6) = P(x = 6) + P(x = 7) + P(x = 8) + P(x = 9) + P(x = 10)$ = 0.99836 (b) $P(x = AB) = P(x = AC) \times P(x = AB) R(= AC) = 0.9 \times 0.4 = 0.36$
P(X=6)=0.06156 for exactly 6 pixelones land on the AB section
The curry. 1- $P(x=6) = 0.93844$, for exactly 4 airelanes land at the out. Section of the curry. and we can get $P(x \ge 6) = 0.0836$ and $1-P(x \ge 6) = 0.9164$.
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$
$(A_1 \bigcirc A_2) \land (A_1 \cap A_2) \cap A_2^c = \emptyset$

Q2.

.(0	GUB) = GCV) · GCRIV)
	$P(X_{1} Y=1) = \frac{P(X_{1})}{P(X=1)} P(X=1 X=1) + P(X=1,Y=1) + P(X=2,Y=1)$ $= 0.0679 + 0.0095 + 0.018$
-	$P(x_0 X=1) = \frac{P(x_0)P(X=1 X=0)}{P(X=1)} = \frac{P(x_0)P(X=1 X=0)}{P(X=1)} = 0.72$
	$P(X_1 Y=1) = \frac{1(X=1,Y=1)}{P(Y=1)} \approx 0.0996$ $P(X_2 Y=1) = \frac{P(X=2,Y=1)}{P(Y=1)} \approx 0.1887$ $P(X=1) = \frac{P(X=1,Y=1)}{P(Y=1)} \approx 0.1887$ $P(X=1) = \frac{P(X=1,Y=1)}{P(Y=1)} \approx 0.1887$
	- the Probability of malung Concer and disease is 0.72 - the Probability of malung Concer is around 0.0996 - the Probability of disease is around 0.1887
_	

Q3.

```
E(X_1) = \sum X_1 C(X_2) = 1.5
E(X_1) = \sum X_1^2 C(X_2) = 1.5
E(X_1^2) = \sum X_1^2 C(X_2) = 3
V(X_1) = E(X_1^2) - [E(X_1)]^2 = 0.75
V(X_2) = E(X_1^2) - [E(X_1)]^2 = 0.75
E(X_1X_2) = \frac{1}{2} \sum X_1 X_2 C(X_1, X_2) = 1.5
X_1 X_2
E(X_1, X_2) - E(X_1) E(X_2) = 1.5 - C_{1.5} \times C_{1.5} = 0.75
0 X_1 C_{10} C_{10} X_2 C_{10} C
```

Q4.

ready csv file:

library(readr)
sales_df <- read.csv("sales.csv")

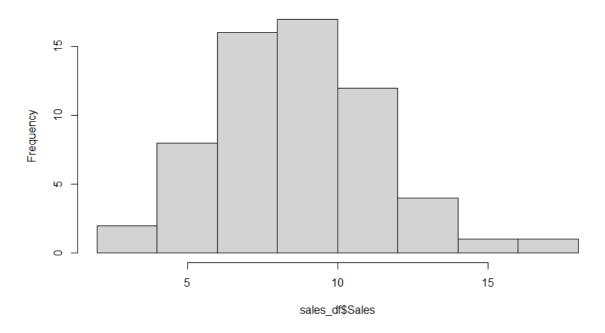

9

1. Identify the most appropriate distribution that models the variable, Sales

hist(sales_df\$Sales)

Resutl:

From the picture, it looks like a normal distribution.

2. (2 marks) Use R to compute the mean of the Price (\$) in the dataset over the time period

```
mean(sales_df$Price....)
```

Resule:145.8862 2

3. (3 marks) Use R to calculate the revenue and attach the daily revenue to the right of the sales table in Sales.csv. Please provide a screenshot of the daily revenue in your solution.

```
sales_df$revenue <- sales_df$Price....*sales_df$Sales
```

Resutl:

3

1

*	Day [‡]	Sales [‡]	Price

58	58	6	173.72
59	59	11	127.48
60	60	14	106.06
61	61	8	154.91

4. (2 marks) Use R to calculate the mean and variance of the revenue (\$) over the 61 days

```
mean(sales_df$revenue)
var(sales_df$revenue)
```

Result:

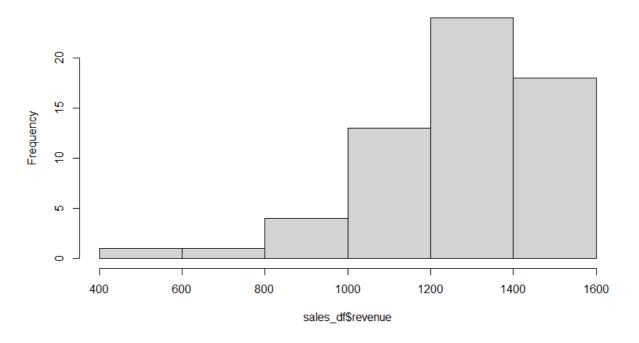

```
> mean(sales_df$revenue)
[1] 1256.292

> var(sales_df$revenue)
[1] 41785.5
```

5. (3 marks) Use R to compute the probability density function for the number of Sales per day and use R to plot a histogram of the number of Sales and the revenue. Assume that the maximum sold per day is 20 units.

```
hist(sales_df$revenue)
table(sales_df$Sales)/nrow(sales_df)
plot(density(sales_df$Sales))
```

Histogram of sales_df\$revenue

```
> table(sales_df$Sales)/nrow(sales_df)

3

density.default(x = sales_df\$Sales)

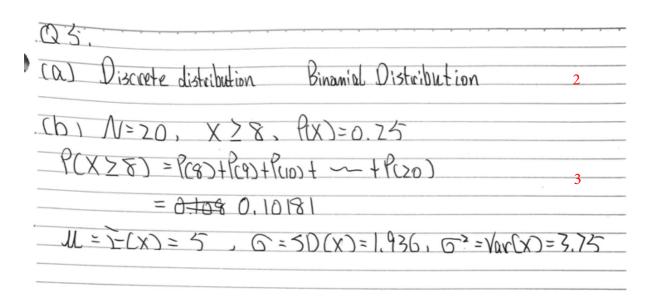

6. (4 marks) The company chooses to fix the Price (\$) per day to be the expected (mean) of Price (\$) over 61 days. The company states that the lowest revenue amount is \$1021 before there is a loss of money. What is the probability that the revenue is less than \$1021?

```
0
> sum(sales_df$Sales*mean(sales_df$Price....) <1021)/nrow(sales_df)
[1] 0.1639344
```

7. (2 marks) Summarise the results in parts a) – f) and give a conclusion in relation to sales and revenue when the company fixes the price.

The company has a very high probability of being profitable. The highest daily sales are between 1200~1400, followed by 1400~1600, and then 1000~1200.

Q5

(c)(4 marks) Use R to plot a probability density function (p.d.f) for X, produce a table for the

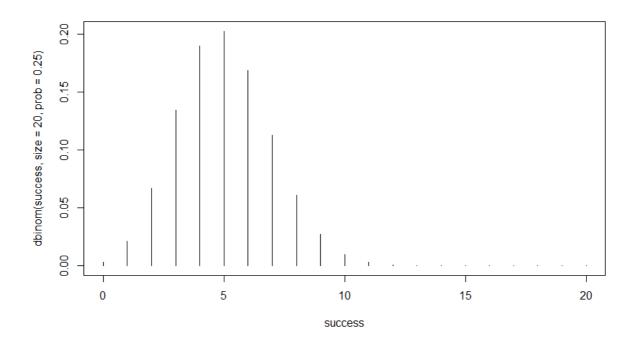

p.d.f and calculate the probability of a student getting 8 or more correct answers.

```
success <- 0:20

plot(success, dbinom(success, size=20, prob=.25), type='h')
y<-dbinom(success, size=20, prob=.25)

pass.df <- data.frame(x=c(0:20), y=y)

sum(pass.df[pass.df$x>=8, ]$y)
```

and

> sum(pass.df[pass.df\$x>=8,]\$y)
[1] 0.1018119

4

Led)
$$N = 10$$
 , $X \ge 3$, $P(X) = 0$, 1081
 $P(X \ge 3) = P(3) + P(4) + \cdots + P(10)$
 $0.07334 0.08482$

Mean=1.018 $0 = 0.9144 6^2 = 0.9563$

e. (5 marks) Use R to simulate the number of correct answers someone gets for 50 students to populate a sample for the class. Compute and compare the mean, variance, plot the distribution and probability of passing to the distribution of X.

```
students <- rep(0, 50)

for(studentId in c(1:50)){
  correctNum <- 0</pre>
```

```
for( i in c(1:20)){
   if(runif(1, 0, 1)<0.25){
      correctNum <- correctNum + 1
    }
}
print(correctNum)
students[studentId] <- correctNum
}

mean(students)
var(students)

set.seed(0)
runif(3,0,1)

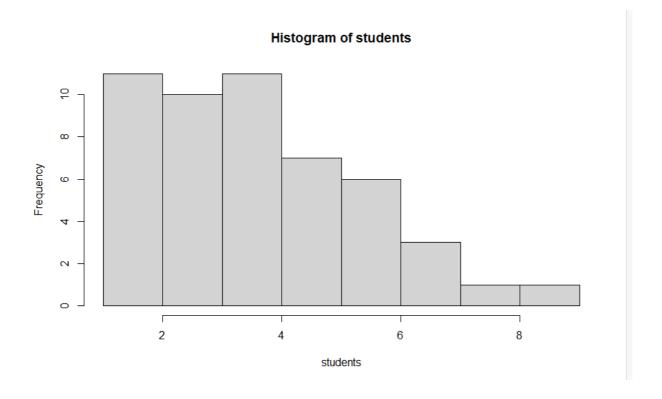

hist(students)
plot(density(students))

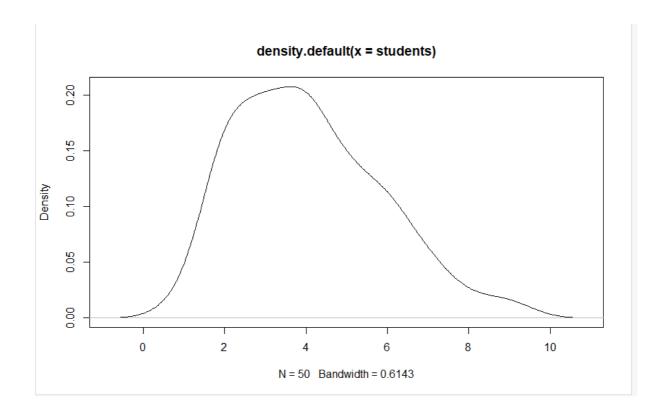

sum(students>=8)/length(students)
```
